

Integrated monitoring and management system for wood pellet heating

IntelliWood

Wood pellet heating installations, widely used in the Baltic region, rely on a stove equipped systems with automatic ignition and an auger-driven feeding mechanism. The stove draws fuel from a metal bunker with limited capacity.

Maintaining a minimum fuel level is critical: if the bunker empties, the automatic ignition system keeps trying to ignite without fuel, eventually destroying the ignition stick and requiring a costly hardware replacement. IntelliWood prevents this.

Four core features:

1. AMBIENT SENSING & SAFETY

monitors CO2, temperature, humidity, smoke & flames in your storage room

2. SECURE ACCESS CONTROL

NFC lock system restricting entry to the storage area

3. STORAGE LOGGING & FORECASTING

3D-printed unit box inventoring and predicting your critical levels

4. DASHBOARD & WEATHER

Mobile app with consumption history and forecasts cross-referenced with weather data
